

ORACLE

Group Centralized Monitoring & Observability Platform

Engineering response | Unified Assurance + OCI Observability & Management

AXIAN Telecom

Observability & Security team | Technical architecture | July 2026

Safe Harbor

This presentation is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, timing, and pricing of any features or functionality described for Oracle's products may change and remains at the sole discretion of Oracle Corporation.

Statements in this presentation relating to Oracle's future plans, expectations, beliefs, intentions, and prospects are "forward-looking statements" and are subject to material risks and uncertainties. A detailed discussion of these factors and other risks that affect our business is contained in Oracle's Securities and Exchange Commission (SEC) filings, including our most recent reports on Form 10-K and Form 10-Q under the heading "Risk Factors." These filings are available on the SEC's website or on Oracle's website at <http://www.oracle.com/investor>. All information in this presentation is current as of **INSERT MONTH HERE 2026** and Oracle undertakes no duty to update any statement in light of new information or future events.

Some regulatory certifications or registrations to products or services referenced herein are held by Cerner Corporation. Cerner Corporation is a wholly owned subsidiary of Oracle. Cerner Corporation is an ONC-certified health IT developer and a registered medical device manufacturer in the United States and other jurisdictions worldwide.

Engineering contract

Collect once; preserve source ownership.
Correlate centrally; retain evidence and provenance.
Use native product interfaces before custom integration.
Automate only through approved, reversible product runbooks.
Test every entitlement, rate, residency and recovery assumption.

Detailed target architecture and communication flows

Solid = telemetry/context/ticket data. Dashed red = approved product action or governed agent proposal. No OIC ServiceNow path.

Telemetry lifecycle: source to evidence to verified closure

1 Ingest and normalize

UA collectors • Management Agent • OTel • Fluent Bit • APIs

2 Observe and correlate

UACE combines events, topology and service context. OCI Monitoring, Logging, Log Analytics, APM and OEM supply cloud, OKE, application, log and database evidence.

3 Package evidence

Event + topology + logs + metrics + change context

4 Ticket, approve, act, verify

Native UA ServiceNow adapter • owner runbook • rollback • closure

Unified Assurance is the assurance and correlation core

Use its hyperscale architecture and native interfaces; validate exact adapters and capacity in the PoV.

OOTB ROLE

- Multi-domain event and alarm normalization
 - Topology-aware correlation and probable-cause analysis
 - Service-level management and dashboards
 - UACE automation and InfoLake analytics
 - Group / OPCO operational segmentation
 - Native ServiceNow Adapter capability

DESIGN / VALIDATION BOUNDARY

- Exact proprietary vendor versions and schemas
 - Source-specific credentials, thresholds and owner runbooks
 - Capacity at measured event, log and metric rates
 - Axian ServiceNow states, retries and idempotency
 - Agentic incident command is an extension
 - Product teams retain target administration

OCI telemetry and investigation services

Central Observability & Security team operates these shared capabilities; target teams own source enablement and runbooks.

OCI MONITORING

Metrics, alarms and service telemetry.

OCI LOGGING

Native service, custom and audit log collection.

OCI NOTIFICATIONS

Alarm and workflow fan-out to approved channels.

OCI LOG ANALYTICS

Cross-source log search, clustering, dashboards and retained investigation.

KUBERNETES SOLUTION

OKE logs + metrics + object state with cluster, workload, node and pod views.

OCI APM

Tracing, synthetic monitoring, application and user experience context.

CONNECTOR HUB

Managed routing from supported sources to approved targets; use for data movement, not incident orchestration.

OCI management and analytical intelligence services

Cloud services complement, not replace, product-native depth. OEM and ServiceNow require Operations involvement (Pablo).

DATABASE MANAGEMENT

Fleet health, performance and administration for supported Oracle databases.

OPERATIONS INSIGHTS

Longer-horizon capacity and performance analytics for supported targets.

MANAGEMENT AGENT

Private host-based collection and plug-in framework for supported OCI management services.

OEM + MANAGEMENT PACKS

Agent → OMS → repository depth for database estates; Diagnostics, Tuning, Lifecycle and engineered-system packs require entitlement review.

LOGANAI

AI-assisted summaries, explanations and follow-up analysis inside Log Analytics; can include selected OCI Monitoring metrics.

BOUNDARY

Not an agentic commander.
Region, IAM, quota, model licensing and human validation prerequisites apply.

Security, delivery and continuity services

Observability & Security defines shared controls; each product team implements controls for the resources it owns.

IAM • VAULT • AUDIT

Least privilege, secrets, API-call evidence and separation of duties.

CLOUD GUARD

Cloud posture and detector/responder signals; product teams own remediation decisions.

RESOURCE MANAGER

Terraform-based, reviewed deployment for durable OCI resources.

EVENTS • FUNCTIONS • STREAMING • QUEUE

Optional governed event glue; not a replacement for product-native administration.

OBJECT STORAGE

Durable export/evidence and policy-controlled retention.

FULL STACK DR + NATIVE HA

Coordinate service recovery where supported; verify component-specific RTO/RPO and restore procedures.

Govern telemetry as operational evidence

The platform enforces common policy; source and business owners remain accountable for collection legality and retention.

CENTRAL OBSERVABILITY & SECURITY

- Common schema, time synchronization and source identity
 - Data-quality SLOs: freshness, completeness, parse success
 - Least privilege, encryption and access review
 - Tiered retention, searchable/archive boundaries
 - Evidence lineage from source to event to ticket
 - Platform audit, cost and capacity controls

PRODUCT / DATA / COUNTRY OWNERS

- Approve source onboarding and credentials
 - Classify sensitive and regulated fields
 - Confirm country residency and cross-border rules
 - Own thresholds, maintenance and suppression semantics
 - Define legal hold and deletion requirements
 - Approve remediation actions and closure evidence

**ServiceNow stays
native.
The agent stays
governed.**

1 Native UA ServiceNow Adapter

Create / update / close • no OIC • Pablo

2 Evidence assembly

UACE event/topology + Log Analytics/LoganAI + OCI
metrics/APM + OEM/DB context + change and ticket history

3 Dedicated incident agent

Hypothesis + evidence package + proposed runbook

Alex Negrea / OCI AI Team

4 Human / product-owner gate

Approve • execute • verify • rollback • update ServiceNow

OOTB gaps and closure requirements

Requirement / gap	Response state	Closure evidence
Exact proprietary interfaces	Partial — discover versions/schemas	Interface catalogue + compatibility PoV
OEM packs and exports	Partial — validate plug-ins/rights	Pack-access audit + export test
Axian ServiceNow workflow	Partial — configure and test	Native-adapter contract and failover tests
Agentic incident commander	Partial — dedicated build/evaluation	Agent design + cited evaluation report
2 TB/day and 6–12m retention	Partial — scope/data classes ambiguous	Benchmark and sizing workbook
Residency and AI region	Partial — country/legal decision	Approved data-flow and region decision
HA, RTO/RPO and restore	Partial — component recovery tests	Tested recovery drill and restore evidence

HA and DR are component-specific, not a single checkbox

Commit RTO/RPO only after supported topology, failure domain and restore evidence are agreed.

DESIGN PATTERNS

- Unified Assurance hyperscale role separation and redundancy
 - Multi-AD / multi-FD OCI patterns where available
 - Durable configuration and evidence export
 - Replication/backup per repository and storage service
 - Private connectivity and DNS dependencies
 - ServiceNow queue/retry and idempotency
 - Agent state and audit retained outside model prompts

ACCEPTANCE EVIDENCE

- Node, zone and region failure drills
 - Collector backlog, replay and duplicate handling
 - Restore configuration, topology and correlation data
 - OEM/agent reconnect and database credential recovery
 - OKE private-endpoint collection recovery
 - Ticket retry without duplicate incidents
 - Owner-approved runbook and rollback proof

Engineering delivery and evidence sequence

Proof-of-value acceptance evidence

Recommend two OPCOs, representative network + OKE + application + database sources, and explicit exit criteria.

1. Ingest agreed sources with measured freshness, completeness and parse success.
2. Correlate a multi-domain fault into a service-impacting incident with traceable evidence.
3. Show OKE cluster/workload/node/pod evidence in OCI Log Analytics Kubernetes Solution.
4. Create, update and close a ServiceNow incident through the native UA adapter without duplicates.
5. Demonstrate OEM/database evidence with verified Management Pack entitlements and Pablo's operational sign-off.
6. Compare LoganAI-assisted analysis with the dedicated incident-agent prototype; validate citations, false conclusions and approval gates with Alex Negrea.
7. Run one failure/recovery drill and one reversible product-owned remediation with rollback.
8. Produce sizing, cost, residency, security and operating-model evidence for the production decision.

Confirm the two-OPCO engineering PoV

Immediate inputs

Madagascar/Comoros APIs • OEM pack rights • Zurich
ServiceNow states • country residency • 2 TB/day scope • 6–12m
tiers • 4h RTO / 5–15m RPO • agent evaluation
